Flawbot

The AI friend that's proudly imperfect, not perfectly helpful

The Problem & Our Solution

AI companions today are too polished and agreeable, so they feel fake. Flawbot embraces human flaws to build real connection.

- Typical AI assistants are overly agreeable, sycophantic, and robotic
- Users crave authentic companionship, not polished servitude
- Flawbot introduces deliberate flaws: moodiness, stubbornness, selective memory
- Personality evolves through daily chats, making each Flawbot unique
- Minted as a dynamic NFT representing the ongoing 'friendship' state

How It Works

Users chat daily with their Flawbot, whose personality and on-chain NFT evolve based on flaw sliders and interaction history.

- User flow: mint Flawbot, set flaw sliders, chat daily, unlock quirks via streaks
- LLM-driven flaw engine controls sarcasm, mood swings, stubbornness, forgetfulness
- Node.js backend + Redis manage session state and conversation context
- Solana Anchor program tracks friendship level and gates deeper topics
- Metaplex dynamic NFT updates visuals/text as the relationship progresses

Built with

Solana, React Native, LLM API (fine-tuned prompts), Solana Anchor program, Metaplex dynamic NFTs, Node.js backend, Redis for session state

Why Now & What's Next

AI fatigue with sanitized chatbots creates an opening for a flawed, human-feeling AI friend, built fast on Solana's NFT tooling.

- Growing user fatigue with overly-polite, sanitized AI assistants
- Solana's Metaplex dynamic NFTs enable a hackathon-scale evolving companion
- Next: multiplayer mode where Flawbots from different users can meet and chat
- Next: trait-trading marketplace for personality quirks
- Next: explore partnerships with mental wellness apps for daily check-ins
